Overview

We use DataAnalytics in everyday life without even knowing i.so we use data analysis process in real life senario as an use case.

Problem Statement

An 20 years old boy analysis which bike to buy. according to his taste and experience and financially good o afford.

Plan

When a Boy plans to buy an bike .he will ask himself what kind of bike he likes .what are his own expectation on bike and when it comes to Money he ask his parents how much they spend on bike and what are they will and expectation .how he bike useful to him in daily life.

Prepare

Later when he got the idea which are bikes available in market and the money his parents can spend on a bike .he prepare where it is available and make a list .

Process

From the above surveys and list of data about the bikes and where there are available and here prices. He cleans up the data according to his prior list what he wants and error free area where bikes are available and relevant outlets and there advantages.

Analyze

He analyzes he cleaned up data and find the relation and patterns in data like which show is giving best offers and in months have the pricing .where they provide best service .with correct data he discovers the key indicator and he find out which bike is best for him and finds out the best result

Share

He communicates the result with his friends like and productive collaboration and discuss the right decision to next step.

Act

Finally he with his family works on the result and finds out which is best bike for him and the family too and implement the best changes to his decision. and takes the final step by findings.
